Introduction to Neo6502

The design goal with Neo6502 was to make simple modern retro computer with 6502 processor.

By modern we mean computer with modern video interface like HDMI, USB keyboard and USB Flash drive as storage. HDMI as everyone have TV with HDMI at home and USB keyboards now are mainstream device for input.

With the task to provide HDMI and USB interface we choose RP2040 which already have DVI bit bang project and USB host.

RP2040 also have enough RAM so we decided to use RP2040 to emulate also the RAM memory for 6502.

For the 6502 processor we choose W65C02 from WDC as they are still in mass production and can be purchased freely.

The Neo name was taken for two reasons, first it imply the modern design, then we liked the analogy with the movie The Matrix as W65C02 lives in virtual world and thinks it have real memory, video and keyboard but actually all this is virtual and emulated by RP2040.

Neo6502 is Open Source Hardware, all CAD files and firmware and available, so people can study and modify.

The features of Neo6502 are:

- real W65C02 processor executing every instruction as it was executed in early retro computers, no emulation for the processor, all timing is exact

- RP2040 with 2MB of SPI Flash, east to load new firmware via drag and drop virtual drive

- HDMI output

- USB host which can be used for programming and to connection to keyboard, mouse, USB Flash etc

- Audio buzzer which you can enable/disable

- Audio 3.5mm connector for external audio amplifier

- USB-C connector for power supply

- 6502 BUS connector with all signals

- UEXT connector with I2C, UART and SPI for connecting to external boards

- 4 position slide switch which allow buzzer enable and connection of RESB, NMIB and IRQB to UEXT GPIO signals if used.

- RP2040 programming bootloader button

- four mounting holes 3.3mm diameter

- Dimension 80x55mm

☞ **Important notice:** If Neo6502 is not mounted in box be careful to not place it on metal surface, nor drop metal objects on top of the PCB! This will lead to damage.

Order codes for RP2040-PICO30 and accessories:

Neo6502   industrial grade modern retro computer

Box-Neo6502-B   plastic box with blue logo

Box-Neo6502-R   plastic box with red logo

USB-CABLE-AM-AM-1-8M   USB-A to A cable necessary for programming RP2040 firmware

CABLE-USB-A-C-1M   USB-C cable for power supply

CABLE-HDMI-50CM   HDMI cable

UEXT modules   many UEXT modules which can connect to Neo6502 UEXT connector

HARDWARE

Neo6502 layout:

HDMI connector

USB host for keyboard, mouse, flash memory

Audio output 3.5mm

USB-C power

W65C02

UEXT connector

Configuration slide switch

BOOT button for programming

2MB Flash

6502 bus

RP2040

Neo6502 6502 bus connector:

All 6502 signals are available on BUS1 connector for attaching external hardware on it.

+5V, 3.3V, GND

D0-D7, A0-A15, PHI2, R/W, RESB, SOB, MLB, VPB, SYNC, NMIB, IRQB

Two signals of RP2040 SWDIO SWCLK are also present for RP2040 debugging, these should be N.C. on the external 6502 peripheral boards.

Neo6502 schematics:

Neo6502 latest schematic is on GitHub
UEXT connector:

UEXT connector stands for Universal EXTension connector and contain +3.3V, GND, I2C, SPI, UART signals.

UEXT connector can be in different shapes.

The original UEXT connector is 0.1" 2.54mm step boxed plastic connector. All signals are with 3.3V levels.

Olimex has developed number of MODULES with this connector. There are temperature, humidity, pressure, magnetic field, light sensors. Modules with LCDs, LED matrix, Relays, Bluetooth, Zigbee, WiFi, GSM, GPS, RFID, RTC, EKG, sensors and etc.

Neo6502 UEXT connector is wired to RP2040 GPIOs as follows:

Slide configuration switch can enable/disable the Buzzer, also can connect or disconnect RESB, NMIB and IRQB to RP2040 UEXT signals.

SWITCH1

SPK	1	SW1_A — SW1_B	8	BUZZER
NMIB	2	SW2_A — SW2_B	7	GPIO27\SPI1_TX(MOSI)
RESB	3	SW3_A — SW3_B	6	GPIO26\SPI1_SCK(CLK)
IRQB	4	SW4_A — SW4_B	5	GPIO25\SPI1_CSn(CS#)

DSHP04TS-S

By default Neo6502 is shipped with all sections connected on the switch i.e. buzzer is enabled and all signals are wired to RP2040. This means you can't use SPI on UEXT connector if you do not disconnect these signals.

SOFTWARE:

Neo6502 is open flexible system as everything is virtual and depend on RP2040 firmware, this allow you to emulate old architectures like Apple][and Oric Atmos, or to make your own completely new architecture.

Veselin Sladkov (veselin.sladkov@gmail.com) did amazing work for Neo6502 and created Apple][, Oric Atmos and Apple Iic emulation with [Reload emulator](#).

The reload emulator require some ROMs and disks which are hosted on olimex's [ftp](#).

Rien Matthijsse (rien@marobi.com) made several versions of RP2040 memulator and EHBasic port working on Neo6502 in his [GitHub repository](#).

Paul Robson (paul@robsons.org.uk) made special version of Neo6502 Basic on [GitHub](#) and web browser [emulator](#).

Programming RP2040

The RP2040 firmware is UF2 file. You can get pre-build firmware of reload emulator on olimex's ftp.

We recommend you for Apple][to use:
https://ftp.olimex.com/Neo6502/uf2/apple2_800x600_400MHz.uf2

This firmware have latest PRODOS and several games on it ready to play.

For Oric Atmos we recommend you to use:

https://ftp.olimex.com/Neo6502/uf2/oric_960x540_372MHz.uf2

To program the .uf2 files you need USB A to A cable.

You disconnect the power supply UEB-C cable, then press the BOOT button and plug the USB-A cable to USB host connector. Your computer will show new drive. Once this new drive show copy the .uf2 file to it. Once the firmware is programmed the drive will dissapear. This means the RP2040 now have the new firmware loaded.

You need to disconnect the USB-A cable and to attach the USB-C power supply cable, in the USB host you should now plug the keyboard and start working with the emulator.
